IntelliJ IDEA Setup Guide

Overview

This setup guide is written with the intention of making sure that everyone involved in the project is working with the same tools, settings, and proper JDK to ensure smooth and equal development. This setup guide is intended to be used by the devlopers working on the project “King Of The Road”.

Prerequisites

- IntelliJ IDEA 2026.3
- JDK 21
- Git

1. Clone The Repository

Paste the address https://github.com/Dev02kt/King-of-the-Road into your web broswers search bar. Once at the repository you will need to create a clone of it on your system, to do so you will first need to create an empty directory on your computer somewhere. It should be somewhere you can easily find and be able to understand what it is, I.e, “C:\Users\Name\Desktop\KingOfTheRoad\”. You have a few options to clone it, however in this setup guide I will be showing you how through the github browser. You will first click on the green “Code” button that can be found by going to the main page of the repository and copy the HTTPS address provided (Figure 1). Once you have that address copied, your next step is going to be to navigate to the new directory you have just created. For this step you will need to have Git installed, if you do not have Git installed you can do so by going to https://git-scm.com/install/ and following the download instructions. Once Git it is installed, you will navigate to the new directory you created, right click on empty space inside of the folder. Click on show more options, and then from that new menu selection click on Open Git Bash here (Figure 2). That will open the bash terminal, where you will enter the command `git clone <REPLACE>`, replacing <REPLACE> with the HTTPS you copied from GitHub. Congratulations, you have now obtained a clean checkout of the project! You may now close out of the git bash terminal.

2. Installing IntelliJ IDEA

In order to install IntelliJ IDEA, you will need to navigate to this link https://www.jetbrains.com/idea/download/?section=windows and follow the download instructions (if you are using an operating system other than windows, make sure to change it on the page right above the download button). Once IntelliJ IDEA is installed, you will first need to import the project. To do so, first launch the IntelliJ IDEA IDE and click on the 4 horizontal lines at the top left of your IDE, click open, and locate the directory where you saved the project clone. It is important to keep in mind that you need to navigate an extra directory down! So if you create a directory called “My Directory” and you cloned the repository into it, to access the project you will need to open the directory called “King-of-the-road”. Once the project is added, next we are going to configure the run configurations. To do so click on the dropdown arrow next to the run button and select “Edit Configurations...”(the run button may be grayed out for you and also yours won’t display the text “HTML”). Check Figure 3.
